

Flanges, Adapters and Sight Ports

Our flanges, adapters and sight ports provide utility and ease of connection for multiple burner components.

How It Works

Adapter plates are added at openings on the burner to mount peep sights, electrodes and other accessories.

Peep sights with glass windows are available in stainless steel or cast iron for low to high temperature

burner applications up to 700° F. Sights can be used in adapter plates or in mounting cage adapters.

Observation ports allow a view into the furnace, kiln or oven interior while the burner is firing.

Applications:

- Any furnace, oven or kiln that requires a view into the combustion chamber
- Burners that need extra length to extend through thick furnace walls

Diverse Combustion Technologies. One Reliable Source.

Operating Principles

Coil cage burner adapters can extend the burner's position farther into the furnace when it would not otherwise mount far enough through the wall of the furnace/oven.

Burner mounting cage adapters facilitate mounting burners and provide attachment points for peep sites and burner pilots.

Features	Benefits
Peep sights are available in stainless or cast iron	Can tolerate high temperatures up to 700° F
Glass observation ports	Clear view of oven, furnace or kiln interior
Adapter plates or coil cage mounts are available	Makes mounting possible even for thick walled furnaces
